Supercharging autor

Our new normal is driving client-demand to automate **monotonous tasks** and augment humans to meet this demand, we are turbocharging auto enable enterprises to automate a broader set

- **Task elimination** targets simple, repetitive these tasks will free employees up to do more closed offices keeping many of its workers them for a record 65 percent of message-k “The resources we are able to deploy through our staff and prioritize their safety and well
- **Task augmentation** supports, speeds up, for example, with the increased use of online AI-powered customer service agents can allow service queues, and increase customer adoption capture information and the nature of the problem to solve. An automation workflow can then engaging a human. That being said, the model when humans and AI systems work hand-in

To achieve these results, we are actively working towards AI-powered automation, which we define automation is defined as a continuous closed-loop patterns are **discovered** and analyzed, such that translated into automated **actions**, with AI pre stage of the process. AI-powered automation business operations with speed, lower cost, a section examines these four stages, illustrating stages.

Discover

Better understand and classify unstructured data, reduce the burden of manually analyzing and orchestrating

Without AI, data discovery associated with unstructured processes and structured data. Unstructured data down the automation process. With the use of AI to cut through, tease out, and detect patterns properly trained classifier model, documents can claim. Similarly, alerts from an IT system can be ticket. With AI, the **discovery process is no longer** intelligently to move from discovery to decision

Speed of automation

The automation process of discover, decide, and do, is a sequential and time-consuming process. Perfecting the automation process can take weeks. For example, the use of RPA and [low-code development](#) for the automation of “bite-size” activities or process steps, without having to wait until the entire end-to-end process is automated, allows business and IT to respond in real-time to external forces.

Automation for every

AI-powered automation does not require every. Contrary, the use of AI enables automation technology population, in addition to the IT developer, high course, the data scientist. Users across the enterprise were prepared in advance by experts — allowing deep AI skills. Delivering AI-powered automation creates an environment where the automation way they work. This provides a more natural integration in enterprise to both contribute and benefit from

IBM and the future of automation

IBM's approach to AI-powered automation takes the form of a converged business and IT automation system with an ability to continually optimize by discovering, deciding, and taking action as a means to automate processes across an enterprise. With this end-to-end view of automation, we are taking a bold step towards creating a hybrid workforce where your employees, collaborating with their digital twins, can gain deeper efficiencies across their business and free up time and money to focus on new business opportunities.

With this post, we have put AI-powered automation on the map — but we're really just getting started. My next post will further define and examine the process behind AI-powered automation, expanding the view to include architecture and capabilities.

Also, [please check out my new podcast called "The Art of Automation,"](#) (link resides outside ibm.com) where I will invite subject matter experts to share their examples of how automation is changing everyday life for the better.
